

A decorative bar chart at the top of the slide with light blue bars of varying heights.

DATA SCIENCE CAPSTONE PROJECT

Diabetes Prediction

A decorative bar chart at the bottom of the slide with dark blue bars of varying heights.

Overview

Objective

Predicting HbA1c
and Diagnosing
Diabetes
Validity of ANNs

Background

What is HbA1c
and Diabetes?

Statistic

New Zealand (2024)
348,000
Diabetic cases

Methodology

No Missing Data

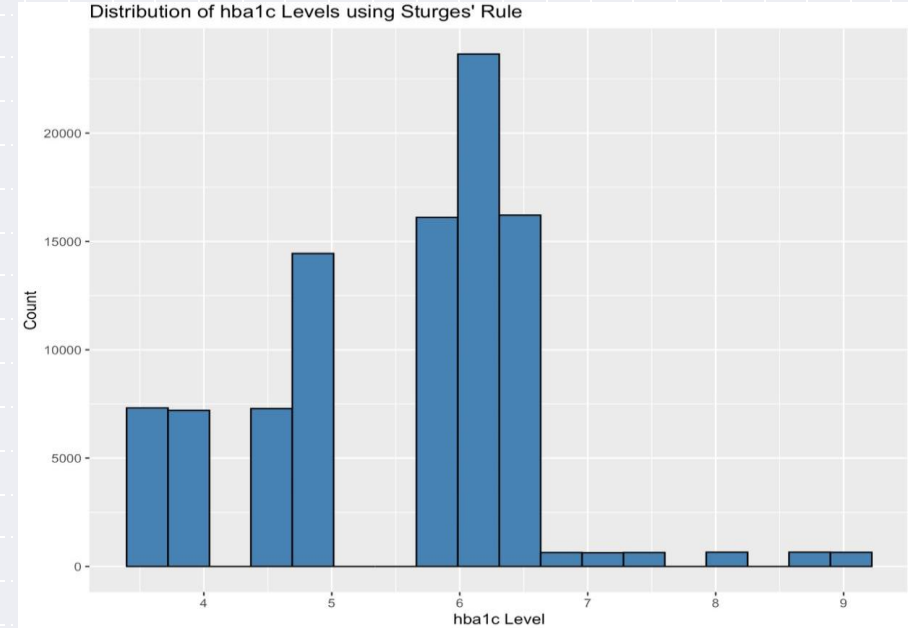

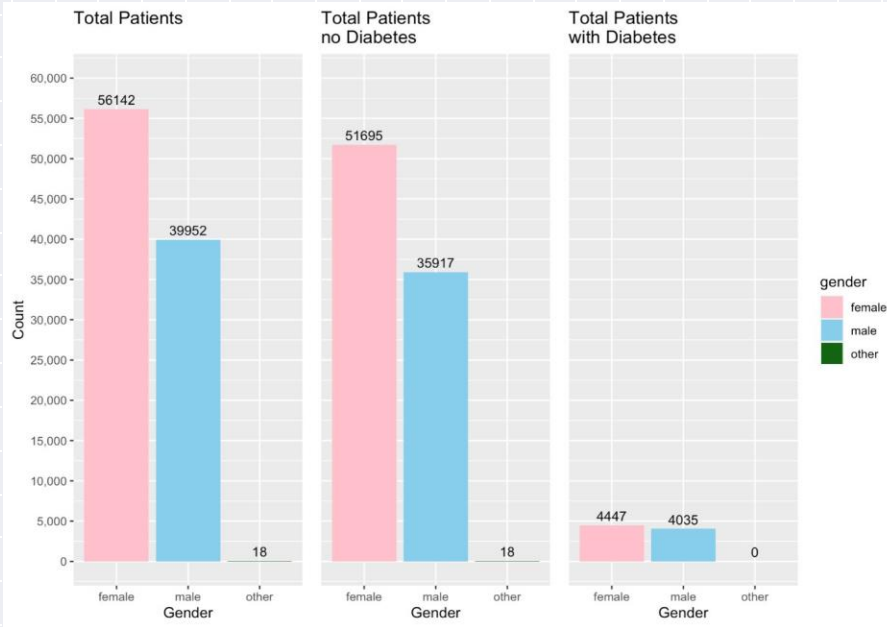

Class Imbalance Categorical Data

Approximately **8%** Duplicates

Right-Skewed Numerical Variable

HbA1c Levels Prediction

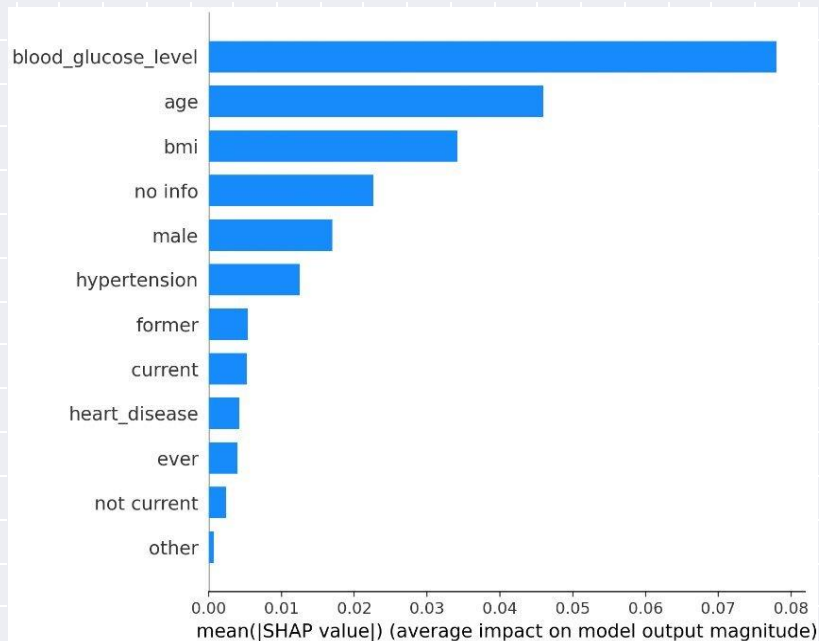

ANN Model		RMSE	MAE	R2	Imp vs Mean	Imp vs Median
Original Model	age + bmi + blood glucose level	1.042	0.876	0.064	6.4	11.8
Adding Features	smoking history	1.043	0.878	0.061	6.1	11.6
	smoking history + heart disease	1.043	0.873	0.062	6.2	11.7
	smoking history + heart disease + hypertension	1.042	0.876	0.063	6.3	11.7
	smoking history + heart disease + hypertension + gender	1.042	0.874	0.063	6.3	11.8
	heart disease	1.040	0.876	0.066	6.6	12.1
Best Model	heart disease + hypertension	1.041	0.875	0.065	6.5	12
	heart disease + gender	1.041	0.876	0.065	6.5	12
	heart disease + hypertension + gender	1.041	0.873	0.065	6.5	11.9
	hypertension	1.040	0.873	0.066	6.6	12.1
	hypertension + gender	1.042	0.873	0.063	6.3	11.8
	hypertension + smoking history	1.043	0.88	0.061	6.1	11.6
Feature Interaction	age * bmi * blood glucose level	1.043	0.876	0.062	6.2	11.7

Chosen Model, RMSE = 1.041, MAE = 0.875, R-Squared = 6.5%

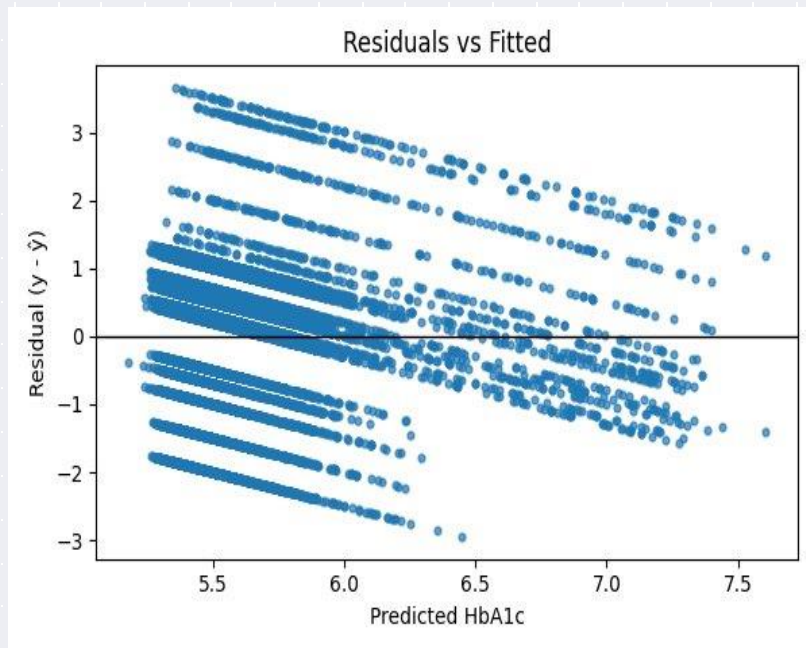

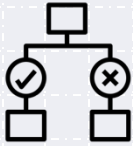

HbA1c Levels Prediction (Continued)

SHAP Feature Importance (ANN)

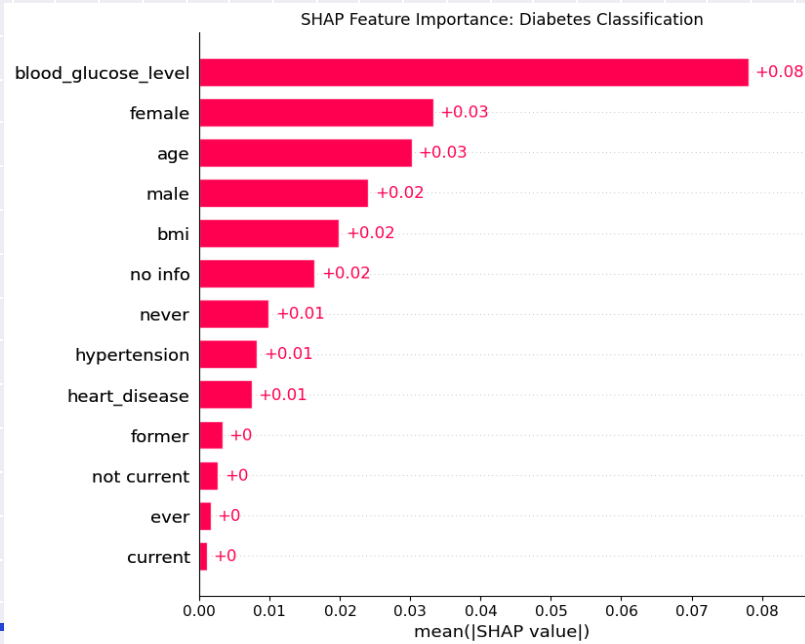

Optimal Model's Performance

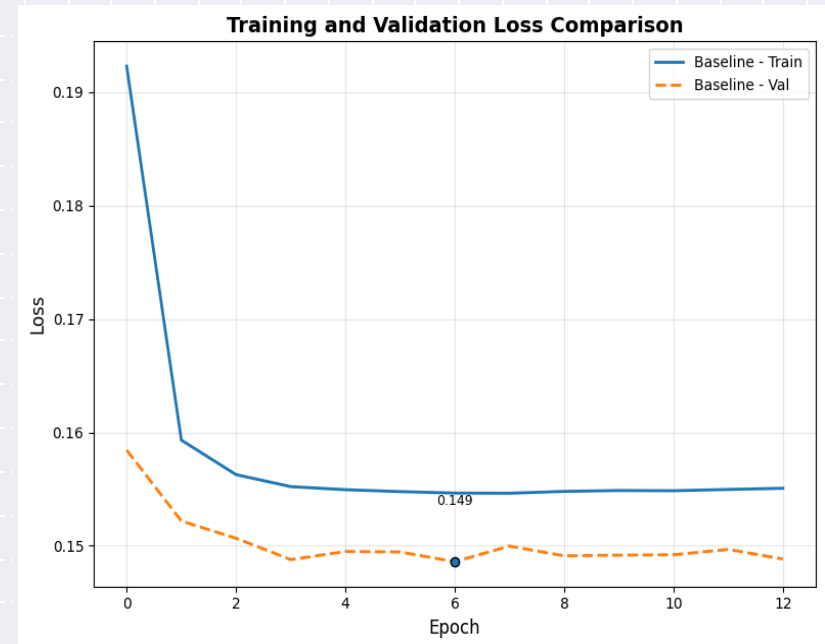

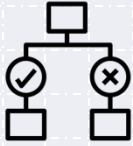

Diabetes Classification

SHAP Feature Importance (ANN)

Optimal Model's Performance

Diabetes Classification (Continued)

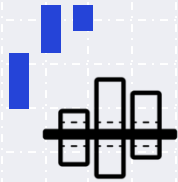

ANN and Logistic Regression were evaluated using

Accuracy, Specificity, Sensitivity, and AUC

? — What is Specificity and Sensitivity?

Classification Table

	ANN	Logistic
Accuracy	0.83	0.83
Specificity	0.83	0.84
Sensitivity	0.84	0.78
AUC	0.92	0.91

Gender Differences

Gender-Based analysis used same predictors and threshold as optimal ANN model

Classification Table

	ANN		Logistic	
	Male	Female	Male	Female
Accuracy	0.82	0.86	0.81	0.85
Specificity	0.82	0.87	0.81	0.86
Sensitivity	0.84	0.80	0.80	0.77
AUC	0.93	0.93	0.90	0.91

Male Model: Better Sensitivity

Female Model: Better Specificity

Real World Application

HbA1c Prediction ANN Model's Key Usage

Early Flagging, Preventative Measure

Diabetes ANN Model's Features of High Importance

Blood Glucose, BMI, and Age

Conclusion

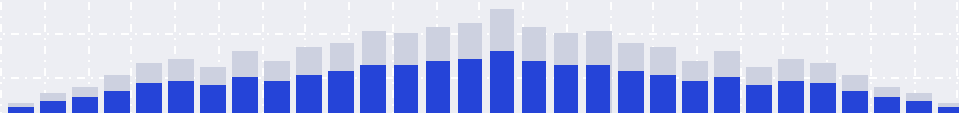

HbA1c Prediction: Weak Prediction Model

Diabetes Prediction: ANN performed better than logistic regression

Gender Based Analysis: Female performed better
